MAINLAND SAND & GRAVEL LOCATION ABBOTSFORD, BC CANADA / 2010-2014 EQUIPMENT HAUL TRUCK APPLICATION GEARBOX

CHALLENGE

The planetary gearboxes in the wheel motors of their CAT 787 Haul Trucks were failing prematurely due to excessive contamination ISO 23/21 (the majority Calcium dust) which was entering into the system through the poor quality air breathers. Traditional kidney loop filtration was unable to remove these particles as they were under 10 microns to sub-micron in size.

SOLUTION

Wes Lindemere of AIT in Grande Prairie, suggested the installation of two OEI two magnetic filter scrubbers as the primary filter on the kidney loop before the traditional Donaldson filter as well as an OEI magnetic y-strainer as a final filter before returning the oil to the differential, with a target of cleaning the oil to a lower than ISO clean oil standard(16/13).

RESULTS

The magnetic filters removed a large amount of both ferrous (10.67%) and non-ferrous (89.33%- with the majority being Calcium) contamination over a six hour loop time resulting in a decrease in ISO to 21/9, see a photo on the right and the analysis (Page 2). The majority of this was below ten microns to sub-micron in size and would have travelled right through

the traditional filter element. By removing this contamination the life of the oil as well as the engine components are extended, increasing uptime. The scrubbers are still in service and working effectively after 4 years.

(the non-ferrous contamination was trapped due to electromagnetic static charge)
