“ We had a potential cost savings of 250K-300K annualized based on 25,000 operating days for Tesco rental fleet”

Stan Sterling, Maintenance Manager

CHALLENGE

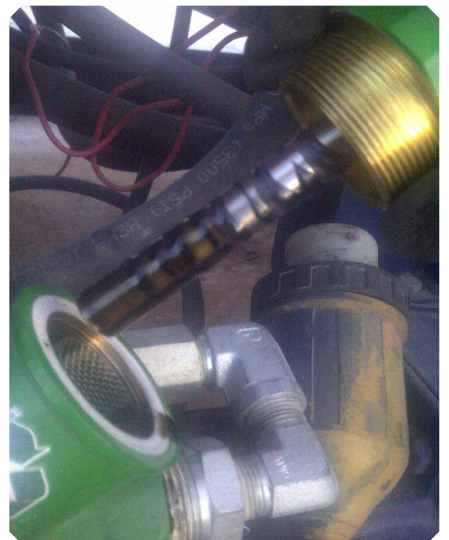

Tesco wanted to extend the life of their equipment by improving filtration capabilities from that of the traditional 10 micron OEM filter elements. High levels of contamination are being missed by these traditional filters which can cause premature wear of the engine components.

SOLUTION

Stan Sterling, Maintenance Manager for Tesco Houston division identified the benefits of installing OEI's magnetic y-strainer for the engine oil in order to increase the filtration efficiency down to sub-micron levels.

RESULTS

A photo on the right shows the amount of contamination removed after just 60 days in operation. By removing contamination down to sub-micron levels the engine pistons, valves and other essential components are being protected and their life extended.
